Instructions for Installing Salt Generator Holder – Wood Version

The Salt Generator holder can be mounted inside a timber sauna room or on a wall of a small room.

Sauna Installation: If installing into a standard 2m tall Sauna, then the TOP of the holder needs to be 14cm down from the internal roof. You can simply screw into the door support beam (as shown) next to where the hinge is located. If fixing onto a side wall of the sauna, then find the stud inside the wall before screwing in the two long screws. Pass the screws through the washers, then through the holder and extension pieces. Place the holder at a height as previously explained.

Small Room Installation: The TOP of the holder needs to be around 190cm up from the floor. This will ensure the Micro Salt Generator outlet is approximately 200 cm up from the floor. If screwing into Gyprock, you will require 2 x Ramset Wallmate screws (not supplied).

Use the double-sided Velcro straps and wrap around the timber holder and the soft touch funnel above and below the extension piece. Ensure the Velcro holds the Microgenerator firmly.

If you have any questions about installation, please call our tech team on 0427 878 378.
